## A combinatorial introduction to reflection groups

## Christopher R. H. Hanusa Queens College, CUNY

people.qc.cuny.edu/chanusa > Talks

## Groups

Today, we will discuss the combinatorics of groups.

- Made up of a set of elements $W=\left\{w_{1}, w_{2}, \ldots\right\}$.
- Multiplication of two elements $w_{1} w_{2}$ stays in the group.
- ALTHOUGH, it might not be the case that $w_{1} w_{2}=w_{2} w_{1}$.
- There is an identity element (id) \& Every element has an inverse.
- Group elements take on the role of both objects and functions.
(Non-zero real numbers)
- We can multiply $a$ and $b$
- It is the case that $a b=b a$
- 1 is the identity: $a \cdot 1=a$
- The inverse of $a$ is $1 / a$.
(Invertible $n \times n$ matrices.)
- We can multiply $A$ and $B$
- Rarely is $A B=B A$
- $I_{n}$ is the identity: $A \cdot I_{n}=A$
- The inverse of $A$ exists: $A^{-1}$.

## Reflection Groups

More specifically, we will discuss reflection groups $W$.

- $W$ is generated by a set of generators $S=\left\{s_{1}, s_{2}, \ldots, s_{k}\right\}$.
- Every $w \in W$ can be written as a product of generators.
- Along with a set of relations.
- These are rules to convert between expressions.
- $s_{i}^{2}=$ id. -and- $\left(s_{i} s_{j}\right)^{\text {power }}=$ id.

For example, $w=s_{3} s_{2} s_{1} s_{1} s_{2} s_{4}=s_{3} s_{2}$ id $s_{2} s_{4}=s_{3}$ ids $s_{4}=s_{3} s_{4}$

Why should we use these rules?

## Pi in the cold of winter

Behold: The perfect wallpaper design for math majors:

To see the reflections, we insert some hyperplanes that act as mirrors.

- In two dimensions, a hyperplane is simply a line.
- In three dimensions, a hyperplane is a plane.

## Reflection Groups

- These regions can be thought of as group elements. Place id.
- The action of multiplying (on the left) by a generator $s$ corresponds to a reflection across a hyperplane $H_{s} . \quad\left(s^{2}=\mathrm{id}\right)$

We see:

- $s t s=t s t \leftrightarrow \quad s t s t s t=i d$ Shows $(s t)^{3}=$ id is natural.
- Our group has six elements: $\{i d, s, t, s t, t s, s t s\}$.
- This is the group of symmetries of a hexagon.

## Reflection Groups

- When the angle between $H_{s}$ and $H_{t}$ is $\frac{\pi}{n}$, relation is $(s t)^{n}=\mathrm{id}$.
- The size of the group is $|S|=2 n$.
- All finite reflection groups in the plane are these dihedral groups.
- Two directions: infinite and higher dimensional.

## Permutations are a group

An $n$-permutation is a permutation of $\{1,2, \ldots, n\}$.

- Write in one-line notation or use a string diagram:

31425

$n$-Permutations form the Symmetric group $S_{n}$.

- We can multiply permutations.
- The identity permutation is id $=1234 \ldots$. .
- Inverse permutation: Flip the string diagram upside down!

## Permutations as a reflection group

A special type of permutation is an adjacent transposition, switching two adjacent entries.

- Write $s_{i}:(i) \leftrightarrow(i+1)$.

$$
\text { (e.g. } s_{3}=12435 \text { ). }
$$

$\star$ Every n-permutation is a product of adjacent transpositions.

- (Construct any string diagram through individual twists.)
- Example. Write 31425 as $s_{1} s_{3} s_{2}$.
- $S=\left\{s_{1}, s_{2}, \ldots, s_{n-1}\right\}$ are generators of $S_{n}$.

A reflection group also has relations:

- First, $s_{i}^{2}=$ id.

| 12345 | 12345 |
| :--- | :--- |
| 21345 | 13245 |
| 23145 | 31245 |
| $\mathbf{3 2 1 4 5}$ | 32145 |

- Consecutive generators don't commute: $s_{i} s_{i+1} s_{i}=s_{i+1} s_{i} s_{i+1}$
- Non-consecutive generators DO commute: $s_{i} s_{j}=s_{j} s_{i}$

## Visualizing symmetric groups

We have already seen $S_{3}$, generated by $\left\{s_{1}, s_{2}\right\}$ :

We can visualize $S_{4}$ as a permutohedron, generated by $\left\{s_{1}, s_{2}, s_{3}\right\}$. sourceforge.net/apps/trac/groupexplorer/wiki/The First Five Symmetric Groups/

They also give a way to see $S_{5} \ldots$

## Higher-dimension symmetric groups

How can we "see" a reflection group in higher dimensions?
The relation $\left(s_{i} s_{j}\right)^{m}$ determines the angle between hyperplanes $H_{i}, H_{j}$ :

- $\left(s_{i} s_{j}\right)^{2}=\mathrm{id} \longleftrightarrow \theta\left(H_{i}, H_{j}\right)=\pi / 2$
- $\left(s_{i} s_{j}\right)^{3}=\mathrm{id} \longleftrightarrow \theta\left(H_{i}, H_{j}\right)=\pi / 3$

For $S_{6}$, we expect an angle of $60^{\circ}$ between the hyperplane pairs

$$
\left(H_{1}, H_{2}\right),\left(H_{2}, H_{3}\right),\left(H_{3}, H_{4}\right), \text { and }\left(H_{4}, H_{5}\right)
$$

Every other pair will be perpendicular.

## All finite reflection groups

Or see with a Coxeter diagram:

- Vertices: One for every generator $i$
- Edges: Between $i$ and $j$ when $m_{i, j} \geq 3$. Label edges with $m_{i, j}$ when $\geq 4$.

## Dihedral groups

Generators: $s$ and $t$. Relation: $(s t)^{m}=\mathrm{id}$

Symmetric groups:

## Wallpaper Groups

The art of M. C. Escher plays upon symmetries in the plane.
An isometry of the plane is a transformation that preserves distance. Think: translations, rotations, reflections, glide reflections.

A wallpaper group is a group of isometries of the plane with two independent translations. Some are also reflection groups:

## Infinite Reflection Groups

Constructing an infinite reflection group: the affine permutations $\widetilde{S}_{n}$.

- Add a new generator $s_{0}$ and a new affine hyperplane $H_{0}$.

Elements generated by $\left\{s_{0}, s_{1}, s_{2}\right\}$ correspond to alcoves here.

## Combinatorics of affine permutations

Many ways to reference elements in $\widetilde{S}_{n}$.

- Geometry. Point to the alcove.
- Alcove coordinates. Keep track of how many hyperplanes of each type you have crossed to get to your alcove.
- Word. Write the element as a (short) product of generators.
- One-line notation. Similar to writing finite permutations as 312 .

Coordinates:

Word: $s_{0} s_{1} s_{2} s_{1} s_{0}$
Permutation:
$(-3,2,7)$

- Others! Lattice path, order ideal, etc.

## Affine permutations

(Finite) n-Permutations $S_{n}$

- Visually:

Affine $n$-Permutations $\widetilde{S}_{n}$

- Generators: $\left\{\mathrm{s}_{0}, \mathrm{~s}_{1}, \ldots, \mathrm{~s}_{n-1}\right\}$
- $s_{0}$ has a braid relation with $s_{1}$ and $s_{n-1}$
- How does this impact one-line notation?
- Perhaps interchanges 1 and $n$ ?
- Not quite! (Would add a relation.)

## Window notation

Affine $n$-Permutations $\widetilde{S}_{n} \quad$ (G. Lusztig 1983, H. Eriksson, 1994) Write an element $\widetilde{w} \in \widetilde{S}_{n}$ in 1 -line notation as a permutation of $\mathbb{Z}$.
Generators transpose infinitely many pairs of entries:

$$
\left.s_{i}:(\mathbf{i}) \leftrightarrow \mathbf{( i + 1}\right) \ldots(n+i) \leftrightarrow(n+i+1) \ldots(-n+i) \leftrightarrow(-n+i+1) \ldots
$$

| $\operatorname{In} \widetilde{S}_{4}$, | $\cdots w(-4)$ | $w(-3)$ | $w(-2)$ | $w(-1)$ | $w(0)$ | $w(1)$ | $w(2)$ | $w(3)$ | $w(4)$ | $w(5)$ | $w(6)$ | $w(7)$ | $w(8)$ | $w(9) \cdots$ |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{s}_{1}$ | $\cdots$ | -4 | -2 | -3 | -1 | 0 | 2 | 1 | 3 | 4 | 6 | 5 | 7 | 8 |
| $\boldsymbol{s}_{0}$ | $\ldots$ | -3 | -4 | -2 | -1 | 1 | 0 | 2 | 3 | 5 | 4 | 6 | 7 | 9 |
|  | $\boldsymbol{s}_{1} \boldsymbol{s}_{0}$ | $\ldots$ | -2 | -4 | -3 | -1 | 2 | 0 | 1 | 3 | 6 | 4 | 5 | 7 |

Symmetry: Can think of as integers wrapped around a cylinder.
$\widetilde{w}$ is defined by the window $[\widetilde{w}(1), \widetilde{w}(2), \ldots, \widetilde{w}(n)] . \quad s_{1} s_{0}=[0,1,3,6]$

## An abacus model for affine permutations

(James and Kerber, 1981) Given an affine permutation [ $w_{1}, \ldots, w_{n}$ ],

- Place integers in $n$ runners.
- Circled: beads. Empty: gaps
- Create an abacus where each runner has a lowest bead at $w_{i}$.

- Generators act nicely.
- $s_{i}$ interchanges runners $i \leftrightarrow i+1 .\left(s_{1}: 1 \leftrightarrow 2\right)$
- $s_{0}$ interchanges runners 1 and $n$ (with shifts) $\left(s_{0}: 1 \stackrel{\text { shift }}{\leftrightarrow} 4\right)$

## Core partitions

For an integer partition $\lambda=\left(\lambda_{1}, \ldots, \lambda_{k}\right)$ drawn as a Young diagram,

The hook length of a box is \# boxes below and to the right.

| 10 | 9 | 6 | 5 | 2 | 1 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 7 | 6 | 3 | 2 |  |  |
| 6 | 5 | 2 | 1 |  |  |
| 3 | 2 |  |  |  |  |
| 2 | 1 |  |  |  |  |

An $n$-core is a partition with no boxes of hook length dividing $n$.
Example. $\lambda$ is a 4 -core, 8 -core, 11 -core, 12-core, etc.

$$
\lambda \text { is NOT a 1-, 2-, 3-, 5-, 6-, 7-, 9-, or 10-core. }
$$

## Core partition interpretation for affine permutations

Bijection: $\{$ abaci $\} \longleftrightarrow\{n$-cores $\}$
Rule: Read the boundary steps of $\lambda$ from the abacus:

- A bead $\leftrightarrow$ vertical step
- A gap $\leftrightarrow$ horizontal step

Fact: This is a bijection!

## Action of generators on the core partition

- Label the boxes of $\lambda$ with residues.
- $s_{i}$ acts by adding or removing boxes with residue $i$.

Example. $\lambda=(5,3,3,1,1)$

- has removable 0 boxes
- has addable 1, 2, 3 boxes.

Idea: We can use this to figure out a word for $w$.

$$
\begin{aligned}
& \begin{array}{|l|l|l|l|ll}
\hline 0 & 1 & 2 & 3 & 0 & 1 \\
\hline 3 & 0 & 1 & 2 & 3 & 0 \\
\hline 2 & 3 & 0 & 1 & 2 & 3 \\
\hline 1 & 2 & 3 & 0 & 1 & 2 \\
\hline 0 & 1 & 2 & 3 & 0 & 1 \\
\hline 3 & 0 & 1 & 2 & 3 & 0
\end{array} \quad \xrightarrow{S_{0}} \quad \begin{array}{|c|c|c|ccc|}
\hline 0 & 1 & 2 & 3 & 0 & 1 \\
\hline 3 & 0 & 1 & 2 & 3 & 0 \\
\hline 2 & 3 & 0 & 1 & 2 & 3 \\
\hline 1 & 2 & 3 & 0 & 1 & 2 \\
0 & 1 & 2 & 3 & 0 & 1 \\
3 & 0 & 1 & 2 & 3 & 0
\end{array} \\
& S_{1} \downarrow \\
& \begin{array}{|l|l|l|l|l|l|}
\hline 0 & 1 & 2 & 3 & 0 & 1 \\
\hline 3 & 0 & 1 & 2 & 3 & 0 \\
\hline 2 & 3 & 0 & 1 & 2 & 3 \\
\hline 1 & 2 & 3 & 0 & 1 & 2 \\
\cline { 1 - 1 } & 1 & 2 & 3 & 0 & 1 \\
\cline { 1 - 2 } & 0 & 1 & 2 & 3 & 0 \\
\hline
\end{array} \\
& \begin{array}{|l|l|l|l|ll|}
\hline 0 & 1 & 2 & 3 & 0 & 1 \\
\hline 3 & 0 & 1 & 2 & 3 & 0 \\
\hline 2 & 3 & 0 & 1 & 2 & 3 \\
\hline 1 & 2 & 3 & 0 & 1 & 2 \\
\hline 0 & 1 & 2 & 3 & 0 & 1 \\
\hline 3 & 0 & 1 & 2 & 3 & 0 \\
\hline
\end{array}
\end{aligned}
$$

## Finding a word for an affine permutation.

Example: The word in $S_{4}$ corresponding to $\lambda=(6,4,4,2,2)$ :
$s_{1} S_{0} S_{2} S_{1} S_{3} S_{2} S_{0} S_{3} S_{1} S_{0}$

| 0 | 1 | 2 | 3 | 0 | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 3 | 0 | 1 | 2 | 3 | 0 |
| 2 | 3 | 0 | 1 | 2 | 3 |
| 1 | 2 | 3 | 0 | 1 | 2 |
| 0 | 1 | 2 | 3 | 0 | 1 |
| 3 | 0 | 1 | 2 | 3 | 0 |$\quad \xrightarrow{S_{1}} \quad$| 0 | 1 | 2 | 3 | 0 | 1 |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 3 | 0 | 1 | 2 | 3 | 0 |  |
| 2 | 3 | 0 | 1 | 2 | 3 |  |
| 1 | 2 | 3 | 0 | 1 | 2 |  |
| 0 | 1 | 2 | 3 | 0 | 1 |  |$\quad \xrightarrow{S_{0}}$

| 0 | 1 | 2 | 3 | 0 | 1 |  | 0 | 1 | 2 | 3 | 0 | 1 |  | 0 | 1 | 2 |  |  | 0 | 1 |  | 0 | 1 | 2 | 3 | 0 | 1 |  | 0 | 1 | 2 | 3 | 0 | 1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | 0 | 1 | 2 | 3 | 0 |  | 3 | 0 | 1 | 2 | 3 | 0 |  | 3 | 0 | 1 |  |  | 3 | 0 |  | 3 | 0 | 1 | 2 | 3 | 0 |  | 3 | 0 | 1 | 2 | 3 | 0 |
| 2 | 3 | 0 | 1 | 2 | 3 | $\xrightarrow{S_{0}}$ | 2 | 3 | 0 | 1 | 2 | 3 | $\xrightarrow{\mathrm{S}_{3}}$ | 2 | 3 | 0 |  |  | 2 | 3 | $\xrightarrow{S_{1}}$ | 2 | 3 | 0 | 1 | 2 | 3 | $\xrightarrow{S_{0}}$ | 2 | 3 | 0 | 1 | 2 | 3 |
| 1 | 2 | 3 | 0 | 1 | 2 |  | 1 | 2 | 3 | 0 | 1 | 2 |  | 1 | 2 | 3 |  |  | 1 | 2 |  | 1 | 2 | 3 | 0 | 1 | 2 |  | 1 | 2 | 3 | 0 | 1 | 2 |
| 0 | 1 | 2 | 3 | 0 | 1 |  | 0 | 1 | 2 | 3 | 0 | 1 |  | 0 | 1 | 2 |  |  | 0 | 1 |  | 0 | 1 | 2 | 3 | 0 | 1 |  | 0 | 1 | 2 | 3 | 0 | 1 |
| 3 | 0 | 1 | 2 | 3 | 0 |  | 3 | 0 | 1 | 2 | 3 | 0 |  | 3 | 0 |  |  |  | 3 | 0 |  | 3 | 0 | 1 | 2 | 3 | 0 |  | 3 | 0 | 1 | 2 | 3 |  |

## The bijection between cores and alcoves

## Simultaneous core partitions

How many partitions are both 2-cores and 3-cores? 2.

How many partitions are both 3 -cores and 4 -cores? 5 .
How many simultaneous $4 / 5$-cores? 14 .
How many simultaneous $5 / 6$-cores? 42.
How many simultaneous $n /(n+1)$-cores? $C_{n}$ !
Jaclyn Anderson proved that the number of $s / t$-cores is $\frac{1}{s+t}\binom{s+t}{s}$.
The number of $3 / 7$-cores is $\frac{1}{10}\binom{10}{3}=\frac{1}{10} \frac{10 \cdot 9 \cdot 8}{3 \cdot 2 \cdot 1}=12$.
Fishel-Vazirani proved an alcove interpretation of $n /(m n+1)$-cores.

## Research Questions

$\star$ Can we extend combinatorial interps to other reflection groups?

- Yes! Involves self-conjugate partitions.
- Joint with Brant Jones, James Madison University.

## Research Questions

$\star$ Can we extend combinatorial interps to other reflection groups?

- Yes! Involves self-conjugate partitions. ar $\chi$ iv:1105.5333
- Joint with Brant Jones, James Madison University.
$\star$ What numerical properties do self-conjugate core partitions have?
- Joint with Rishi Nath, York College.
- We found \& proved some impressive numerical conjectures.
- There are more (s.c. $t+2$-cores of $n$ ) than (s.c. $t$-cores of $n$ ).

6 -cores of 22

8 -cores of 22
